The Challenge

The University of Milan was facing the challenge of adapting to the growth in popularity of cloud storage. Various users of The Universities' data were using unsafe and uncontrolled public cloud storage platforms. The Informations Systems division was searching for an efficient private cloud solution that could provide heterogenous data access with low TCO and easy management.

The Solution

The University of Milan deployed a Syneto ARK Series storage. It can easily scale up to 100TB and provide multi-protocol data access. The ARK Series, coupled with The Universities' own UnimiBox software client based on the OwnCloud open source software, created a powerful Private Cloud available to all the various users. Data safety is ensured with Syneto Storage OS's snapshot capabilities while data is stored efficiently with in-line deduplication and compression.
